IN THE CLAIMS

This listing of the claim will replace all prior versions and listings of claim in the present application.

Listing of Claims

1. (currently amended) A method of displaying noticeable images, comprising the steps of:

receiving coded, or compressed data of moving pictures through a transmission path;

detecting the a picture type of said compressed data ~~from~~ of said received compressed data of moving pictures;

if the picture type of said received compressed data of moving pictures is intra picture, supplying predetermined image data to a monitor so that ~~it~~ said predetermined image data can be displayed thereon, and ~~also~~ to a memory so that ~~it~~ said predetermined data can be stored in said memory; and

if the picture type of said detected compressed data is inter picture, adding image data resulting from decoding said received compressed data, and ~~said~~ image data stored in said memory, and supplying the data resulting from ~~said the~~ addition to said monitor so that ~~it~~ said data resulting from the addition can be displayed thereon and ~~also~~ to said memory so that ~~it~~ said data resulting from the addition can be stored in said memory,

wherein said predetermined image data is data unrelated to intra-picture compressed data included in said received compressed data.

2. (original) A method according to claim 1, wherein said step of detecting the picture type of said compressed data detects the picture type of said compressed data from header information of said compressed data.

3. (currently amended) A method according to claim 1, wherein said predetermined ~~fixed~~-image data is selected to be fixed image data of a fixed color-all.

4. (currently amended) An apparatus for processing and displaying noticeable images, comprising:

a detector for detecting ~~the~~ a picture type of coded, or compressed data of moving pictures received through a transmission path;

a decoding processor for decoding said received compressed data and producing ~~said~~-decoded image data;

a memory for storing image data fed from an adder; and

said adder that, depending on the picture type of said compressed data detected by said detector, either supplies predetermined image data to a monitor so that said predetermined image data can be displayed on said monitor and stores said predetermined image data in said memory, or adds said decoded image data from said decoding processor and ~~said~~-image data stored in said memory, and supplies ~~said~~-data resulting from ~~said~~ the addition to said monitor so that said ~~added~~-data resulting from the addition can be displayed on said monitor and ~~also~~ to said memory so that said ~~added~~-data resulting from the addition can be stored in said memory.

wherein said predetermined image data is data unrelated to intra-picture compressed data included in said received compressed data.

5. (original) An apparatus according to claim 4, wherein said detector detects the picture type of said compressed data from the header information of said compressed data.

6. (currently amended) An apparatus according to claim 4, wherein said predetermined ~~fixed~~ image data is selected to be fixed image data of a predetermined color-~~all~~.

7. (currently amended) A remotely monitoring system comprising:
a transmitter for transmitting coded, or compressed data of moving pictures through a transmission path; and

a receiver for receiving said coded, or compressed data of moving pictures transmitted through said transmission path, decoding said compressed data to produce decoded image data of the moving pictures and displaying said decoded data of the moving pictures,

wherein said receiver comprisescomprising:

a detector for detecting ~~the~~ a picture type of said coded, or compressed data of moving pictures received through said transmission path;

a decoding processor for decoding said received compressed data and producing said decoded image data;

a memory for storing image data from an adder; and

wherein said adder that, depending on the picture type of said compressed data detected by said detector, ~~either~~ supplies predetermined image data to a monitor so that ~~it~~ said predetermined image data can be displayed thereon and to said memory so that ~~it~~ said predetermined image data can be stored therein, or adds said decoded image data fed from said decoding processor and ~~said~~ image data stored in said memory and supplies ~~said-added data~~ resulting from the addition to said monitor so that ~~it~~ said added data can be displayed thereon and ~~also~~ to said memory so that ~~it~~ said added data can be stored therein.

wherein said predetermined image data is data unrelated to intra-picture compressed data included in said received compressed data.

8. (original) A remotely monitoring system according to claim 7, wherein said detector detects the picture type of said compressed data from the header information of said compressed data.

9. (currently amended) A remotely monitoring system according to claim 7, wherein said predetermined ~~fixed~~ image data is selected to be fixed image data of a predetermined color-~~all~~.
